Paper 1 Multiple Choice

6092 / 01  
28 August 2024  
1 hour

Additional Materials: Multiple Choice Answer Sheet.  
Setter: Ms Koh Li Eng

READ THESE INSTRUCTIONS FIRST

Write in soft pencil.

Do not use staples, paper clips, highlighters, glue or correction fluid.

Write your name, class and register number on the Answer Sheet in the spaces provided unless this has been done for you.

There are **forty** questions on this paper. Answer **all** questions. For each question there are four possible answers **A, B, C** and **D**.

Choose the **one** you consider correct and record your choice in **soft pencil** on the separate Answer Sheet.

Read the instructions on the Answer Sheet very carefully.

Each correct answer will score one mark. A mark will not be deducted for a wrong answer.

Any rough working should be done in this booklet.

A copy of the Periodic Table is printed on page 22.

The use of an approved scientific calculator is expected, where appropriate.

This document consists of **22** printed pages.

2

- 1 Diagrams 1, 2 and 3 show the particles of three substances at room temperature and pressure.

Which of these substances are correctly represented by the corresponding diagram?

	1	2	3
A	argon	mercury	dry ice
B	ethane	sodium chloride	mercury
C	ethanol	hydrogen chloride	copper
D	water	helium	zinc

- 2 The set-up below shows how the relative rate of diffusion of gas X and Y can be determined.

Which pair of substances could X and Y be if the water level at Z increases?

	X	Y
A	argon	ethane
B	neon	carbon monoxide
C	oxygen	methane
D	carbon dioxide	nitrogen

KCPSS 2024/Sec 4Exp Prelim Chem P1

[Turn Over

- 3 The diagram shows a simple laboratory set-up used to prepare and collect a dry gas.

Which pair of reagents would be most suitable to prepare the gas produced using this set-up?

	solid A	solution B
A	ammonium chloride	sodium hydroxide
B	magnesium	sulfuric acid
C	potassium carbonate	aqueous ammonia
D	sodium hydroxide	hydrochloric acid

- 4 The three main components of liquid air are nitrogen, oxygen and argon. Their respective boiling points are:

nitrogen:  $-196^{\circ}\text{C}$   
 oxygen:  $-183^{\circ}\text{C}$   
 argon:  $-186^{\circ}\text{C}$

Liquid air can be separated into its three main components by fractional distillation. The graph shows the temperature of a liquid air mixture as it is heated.

In section P of the graph, the mixture remaining consists of

- A liquid nitrogen and argon only.
- B liquid nitrogen only.
- C liquid oxygen and argon only.
- D liquid oxygen only.

- 5 The diagram shows the chromatogram obtained from the analysis of a dye mixture. Four measurements are shown in the diagram below.

What is the  $R_f$  value of the most soluble dye?

- A 0.20  
B 0.80  
C 1.25  
D 5.00

- 6 The solubilities of three solids in water and tetrachloromethane are given in the table below.

solid	solubility in water	solubility in tetrachloromethane
sand	not soluble	not soluble
sodium chloride	good	not soluble
sulfur	not soluble	good

Which of the experimental procedures would be suitable for obtaining pure sand from a mixture of sand, sodium chloride and sulfur?

- A Add tetrachloromethane and stir, then filter to collect residue.  
B Add tetrachloromethane and stir, then filter. Add the residue to water and stir, then filter to collect residue.  
C Add water and stir, then filter. Add tetrachloromethane to filtrate and stir, then evaporate to dryness.  
D Add water and stir, then filter. Evaporate the filtrate to dryness.

- 7 Which pair of statement correctly describes the properties of the compound iron(II) sulfide,  $\text{FeS}$ , and a mixture of iron and sulfur?

	iron(II) sulfide	mixture of iron and sulfur
1	The ratio of iron to sulfur is always 2 : 1.	The ratio of iron to sulfur can vary.
2	Iron(II) sulfide has the same properties as iron and sulfur.	The mixtures do not have the same properties as iron and sulfur.
3	Iron and sulfur react when heated to form iron(II) sulfide.	Iron and sulfur mix together with no energy change.

- A 1 and 2  
B 1 and 3  
C 3 only  
D All the above

- 8 An ion of formula  $\text{X}^{2-}$  contains 10 electrons.

If the relative atomic mass of X is 16, what is present in the nucleus of the ion?

- A 8 protons and 8 neutrons  
B 10 protons and 6 neutrons  
C 10 protons and 10 neutrons  
D 12 protons and 8 electrons

- 9 Which compound contains both ionic and covalent bonds?

- A ammonia  
B barium chloride  
C methyl propanoate  
D potassium sulfate

- 10 Which substance has metallic bonding?

substance	electrical conductivity		property of product formed from the reaction between substance and oxygen
	in solid state	in molten state	
A	X	X	reacts with alkali
B	X	✓	no reaction with acid or alkali
C	✓	✓	reacts with alkali
D	✓	✓	reacts with both acid and alkali

- 11 An investigation of the properties of the chlorides of Period 3 elements shows that the boiling points of sodium chloride and silicon tetrachloride are 1465°C and 57°C respectively.

This difference in boiling points is a result of

- A covalent bonds being weaker than ionic bonds.  
 B metallic character decreasing across the period.  
 C silicon forming weaker bonds with chlorine as compared to sodium.  
 D silicon tetrachloride having weak intermolecular forces of attraction.

- 12 Two comments about hydrogen chloride are made below.

Comment 1: Hydrogen chloride has strong covalent bonds in its simple molecular structure.

Comment 2: Hydrogen chloride is soluble in water.

Which statement is correct?

- A Both comments are correct and comment 1 explains comment 2.  
 B Both comments are correct but comment 1 does not explain comment 2.  
 C Both comments are incorrect.  
 D Comment 2 is correct but comment 1 is incorrect.

- 13 Bismuth is in the same group as nitrogen in the Periodic Table.

What is the chemical formula of lithium bismuthide?

- A  $\text{Li}_3\text{Bi}$   
 B  $\text{LiBiO}_3$   
 C  $\text{LiBi}_3$   
 D  $\text{Li}_3\text{BiO}$

- 14 Which substance contains the greatest number of atoms in 1g?

- A  $\text{CO}_2$   
 B NO  
 C  $\text{O}_3$   
 D  $\text{SO}_3$

- 15 200  $\text{cm}^3$  of ammonia burns in 100  $\text{cm}^3$  of oxygen according to the following equation:

What volume of gas will be collected at the end of the reaction when cooled to room temperature?

- A 66.7  $\text{cm}^3$   
 B 100.0  $\text{cm}^3$   
 C 133.3  $\text{cm}^3$   
 D 333.3  $\text{cm}^3$

- 16 Magnesium oxide is produced by heating magnesium carbonate.

When 84 g of magnesium carbonate is heated, 34 g of magnesium oxide is produced.

What is the percentage yield of magnesium oxide?

[Mr:  $\text{MgCO}_3$ , 84;  $\text{MgO}$ , 40]

- A  $\frac{34}{40} \times 100$   
 B  $\frac{34}{84} \times 100$   
 C  $\frac{40}{34} \times 100$   
 D  $84 \times \frac{34}{40} \times 100$

- 17 20.0 cm<sup>3</sup> of 0.500 mol/dm<sup>3</sup> hydrochloric acid were added to 0.7 g of a sample of sodium carbonate containing some sodium chloride as impurity. The excess acid was neutralised by 10.0 cm<sup>3</sup> of 0.400 mol/dm<sup>3</sup> of sodium hydroxide solution.

What is the percentage purity of the sodium carbonate in the sample?

[Mr:  $\text{HCl}$ , 36.5;  $\text{Na}_2\text{CO}_3$ , 106;  $\text{NaOH}$ , 40]

- A 31.8%  
 B 45.4%  
 C 63.6%  
 D 90.9%

- 18 Arsine ( $\text{AsH}_3$ ) is a gas that behaves like ammonia.

Which of the following particles are found in the solution when Arsine dissolves in water?

- A  $\text{As}^+$  and  $\text{OH}^-$   
 B  $\text{AsH}_3$ ,  $\text{As}^+$  and  $\text{OH}^-$   
 C  $\text{AsH}_4^+$  and  $\text{OH}^-$   
 D  $\text{AsH}_3$ ,  $\text{AsH}_4^+$  and  $\text{OH}^-$

- 19 Which method(s) is/are suitable to test the strengths of acids and alkalis?

- 1 titration  
 2 using a pH meter  
 3 measuring their electrical conductivity

- A 1 only  
 B 1 and 2  
 C 2 and 3  
 D all of the above

- 20 Different indicators change colour over different pH ranges and it is important to choose the correct indicator to obtain an accurate result in a titration.

The graph below shows the change of pH when ethanoic acid is added to a fixed volume of aqueous sodium hydroxide in a titration.

Which would be the most suitable indicator to use in this titration?

indicator	pH range for the colour change	colour	
		lower pH	higher pH
A	0.3 – 3.0	yellow	violet
B	4.2 – 6.3	red	yellow
C	8.2 – 10.0	colourless	pink
D	11.6 – 14.0	blue	yellow

- 24 The table shows the voltage produced by some cells when different metals are used together with copper.

metal 1	metal 2	voltage / V
silver	copper	-0.46
magnesium	copper	+2.69

What would be the likely voltage obtained when silver is used as metal 1 and magnesium is used as metal 2?

- A -2.23 V  
B -3.15 V  
C 2.23 V  
D 3.15 V

- 25 Which of the following reactions takes place in a hydrogen fuel cell?

- A Hydrogen ions are oxidised at the anode.  
B Hydrogen ions are reduced at the cathode.  
C Hydrogen loses electrons to form  $H^+$  ions at the anode.  
D Oxygen gains electrons to form  $O^{2-}$  at the cathode.

- 26 The set-up below shows the reaction of substance X.

What is the possible identity of X?

- A X is a metal above hydrogen in the reactivity series.  
B X is a metal below hydrogen in the reactivity series.  
C X is an oxide of a metal that is above hydrogen in the reactivity series.  
D X is an oxide of a metal that is below hydrogen in the reactivity series.

- 27 The bar chart shows the variation of a specific property of elements in Period 2 from lithium to neon.

Which property of these elements is shown in the chart?

- A atomic radius  
B melting point  
C number of electrons used in bonding  
D number of shells holding electrons

28 The elements in a group of Periodic Table shows the following trends.

- The element with the lowest proton number has the lowest reactivity.
- The melting point of the elements decreases down the group.
- The density of the elements increases down the group

Which group can the elements be found in?

- A 1  
B 17  
C 18  
D transition

29 The following observations were made when nickel and iron were placed separately into salt solutions of metals S, T and U.

	salt solution of S	salt solution of T	salt solution of U
nickel	solid deposit formed	no visible change	no visible change
iron	solid deposit formed	solid deposit formed	no visible change

What is the correct order in decreasing reactivity of the five metals?

- A  $S > Ni > Fe > T > U$   
B  $S > Ni > T > Fe > U$   
C  $U > Fe > T > Ni > S$   
D  $U > T > Fe > Ni > S$

30 An old railway carriage is being restored by having metal strips secured to the outside of the wooden carriage by means of screws.

After a few weeks of being exposed to wind and rain, the screws are heavily corroded but the metal strips are not.

Which two metals would give this result?

	screw	strip
A	copper	iron
B	copper	zinc
C	iron	copper
D	iron	magnesium

31 For which process is the enthalpy change always positive?

- A boiling  
B combustion  
C dissolving of acids in water  
D respiration

- 32 Manganese(IV) oxide catalyses the decomposition of aqueous hydrogen peroxide into water and oxygen.

In order to follow the rates of this reaction for two different solutions of hydrogen peroxide, the total volumes of oxygen evolved were recorded at regular time intervals and the results were plotted. In each experiment, the same mass of catalysts were used and the temperature was kept constant.

If curve 1 corresponds to 25.0 cm<sup>3</sup> of 4.0 mol/dm<sup>3</sup> of solution, curve 2 would correspond to

- A 7.5 cm<sup>3</sup> of 8.0 mol/dm<sup>3</sup> solution.
- B 12.5 cm<sup>3</sup> of 4.0 mol/dm<sup>3</sup> solution.
- C 25.0 cm<sup>3</sup> of 2.0 mol/dm<sup>3</sup> solution.
- D 25.0 cm<sup>3</sup> of 8.0 mol/dm<sup>3</sup> solution.

- 33 Which statement about the fractional distillation of crude oil is correct?

- A At each level of the fractionating column, only one compound is collected.
- B The fraction at the top of the column is the least flammable.
- C The fraction collected at the bottom of the column has the highest viscosity.
- D The higher up the fractionating column, the higher the temperature.

- 34 Banana releases a gas that is able to make other fruit ripen. When this gas is bubbled into aqueous bromine, the reddish-brown solution decolourises.

What could be the identity of this gas?

- A ethane
- B ethene
- C iodine
- D sulfur dioxide

Answer questions 35 and 36 based on the following information.

The reaction pathways of the conversions between the 4 organic chemistry homologous series are as shown below.

- 35 How many of the above reactions are redox reactions?

- A 0
- B 2
- C 4
- D 6

- 36 Which of the following shows the correct reactant and conditions for reaction pathway 1?

	reactant	conditions
A	hydrogen	150 °C, Ni catalyst
B	hydrogen	UV light
C	none	600 °C, Al <sub>2</sub> O <sub>3</sub> and SiO <sub>2</sub> as catalysts
D	none	37 °C, yeast, absence of oxygen

37 Five structural formulae are shown below.

How many of the structures represent isomers of one another?

- A 2 B 3  
C 4 D 5

38 A student investigated the reaction of different vegetable oils and margarines with hydrogen.

100 cm<sup>3</sup> of hydrogen was passed through 1 g samples containing a catalyst. The volume of hydrogen gas remaining in each reaction was recorded in the table below.

sample	volume of hydrogen remaining / cm <sup>3</sup>
P	0
Q	87
R	100

Which sample(s) is/are unsaturated vegetable oils?

- A P only  
B P, Q and R  
C P and Q  
D R only

39 In which reaction is water **not** a product?

- A combustion of petroleum gases  
B esterification between propanoic acid and butanol  
C fermentation of glucose  
D neutralization between dilute nitric acid and aqueous ammonia

The volume of one mole of any gas is  $24 \text{ dm}^3$  at room temperature and pressure (r.t.p.).  
The Avogadro constant,  $L = 6.02 \times 10^{23} \text{ mol}^{-1}$ .

## The Periodic Table of Elements

[illegible]

- 2 Complete the table to name the most appropriate separation technique that can be used to obtain the substance underlined in the mixture.

mixture	separation technique
ammonium chloride + sodium chloride	
water + <u>lead(II) sulfate</u>	
<u>methanol</u> + glucose solution	

[3]

[Total: 3]

- 3 An experiment was carried out to investigate the rate of reaction between magnesium and dilute nitric acid using the apparatus shown in Fig. 3.1.

[3]

[Total: 5]

Fig. 3.1

- (a) Complete Fig. 3.1 by filling in the empty boxes to identify the apparatus. [2]

- (b) 2.0 g of magnesium was added to 100 cm<sup>3</sup> of 1.5 mol/dm<sup>3</sup> of dilute nitric acid. Show that magnesium is used in excess in this reaction.

- 4 The relative abundance of isotopes can be determined experimentally using a technique called mass spectrometry. Fig. 4.1 shows the mass spectrum of copper isotopes and their respective natural abundance.

Fig. 4.1

- (a) Based on the information, calculate the relative atomic mass of copper. Show your workings clearly and give your answer to the nearest whole number.

[3]

[Total: 9]

- (ii) Name the type of reaction that occurred between  $\text{CuCl}_2$  and  $\text{AgNO}_3$ .  
..... [1]
- (iii) Under suitable conditions,  $\text{CuCl}_2$  can be converted into a compound **X** which is pale green in colour. The composition of **X** by mass is Cu, 21.5%, F, 38.7%, K, 39.8%.  
Use the information to work out the empirical formula of compound **X**. Show your working clearly.

[2]

- (b) Copper is a typical transition element with many of its compounds having colours. An example is copper(II) chloride solution,  $\text{CuCl}_2$ , which is green-blue in colour.

- (i) Complete Fig. 4.2 with the expected observations when  $\text{CuCl}_2$  undergoes the different reactions.

Fig. 4.2

[3]

- 5 Fig. 5.1 shows two set-ups that a student used to investigate the difference in the reactions between an electrolytic cell and a simple cell.

- (a) Draw arrows in Fig. 5.1 to show the flow of electrons on both set-ups clearly. [1]
- (b) It was observed that the zinc electrodes of both set-ups change in size.
- (i) State and explain the expected changes in sizes of the zinc electrodes in both set-ups.

Your answer should:

- describe the expected change in size in each set-up
- explain why each change occurs
- give half-equations for each change.

[5]

- (ii) Describe two differences, other than the change in size of the zinc electrode, in the observations between the two set-ups.

[2]

- (c) The student would like to prepare more zinc sulfate and copper(II) sulfate for the experiments.

Complete the table below to identify the starting reagents needed. Include state symbols.

salt	formulae of starting reagents used
$\text{ZnSO}_4 (\text{s})$	(1) ..... (2) $\text{H}_2\text{SO}_4 (\text{aq})$
$\text{CuSO}_4 (\text{s})$	(1) ..... (2) $\text{H}_2\text{SO}_4 (\text{aq})$

[2]

[Total: 10]

- 6 In the Haber process, nitrogen and hydrogen are reacted together to form ammonia.
- $$\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$$
- (a) Describe the arrangement and movement of ammonia particles at room temperature and pressure.

[1]

Table 6.1 shows some bond energies of the covalent bonds of nitrogen and hydrogen atoms.

Table 6.1

bond	bond energy in kJ/mol
N-N	160
N=N	418
N≡N	941
N-H	391
H-H	436

- (b) Based on information given in Table 6.1, describe and explain the trend of bond energy between nitrogen atoms.

[2]

- (c) (i) Using the data given in Table 6.1, calculate the overall enthalpy change for the forward reaction of the Haber process.

Show your working.

- (ii) Hence, state the energy change for the backward reaction where 2 moles of ammonia decomposes.

[1]

[Total: 7]

- 7 A study has been done on the cracking of poly(propene),  $(\text{C}_3\text{H}_6)_n$ , as a possible alternative to solving plastic waste. It is an endothermic reaction which requires nano materials as catalyst. The products are mainly  $\text{C}_7 - \text{C}_{10}$  hydrocarbons.

- (a) Draw the energy profile diagrams to show the effect of the catalyst on the energy changes in the cracking of poly(propene).

Your diagrams should show:

- the reactants and products of the reaction
- the activation energy of the reaction
- the enthalpy change of the reaction,  $\Delta H$

[3]

- (b) (i) Draw the structure of the repeating unit of poly(propene) and give the empirical formula of poly(propene).

[2]

- (ii) Using its empirical formula from (b)(i), construct a balanced chemical equation for the complete combustion of poly(propene).

[1]

- (iii) Hence, calculate the volume of carbon dioxide produced when 5 kg of poly(propene) is completely burned in air.

[2]

- (c) Poly(propene) is a main form of plastic waste because of its wide variety of applications such as water pipes.

Suggest an advantage and a disadvantage of using poly(propene) instead of iron to make water pipes.

[2]

[Total: 10]

8 The table shows some information of the homologous series of a class of organic compounds called dicarboxylic acids.

name	condensed formula	*skeletal formula
ethanedioic acid	HOOC <sub>2</sub> COOH	
propanedioic acid	HOOCCH <sub>2</sub> COOH	
pentanedioic acid	HOOC(CH <sub>2</sub> ) <sub>3</sub> COOH	
hexanedioic acid	HOOC(CH <sub>2</sub> ) <sub>4</sub> COOH	

\*In skeletal formulae, the carbon atoms are implied to be located at the corners and ends of line segment rather than being indicated by the atomic symbol C. Hydrogen atoms attached are also not indicated but understood to be present accordingly.

- (a) (i) Fill in the table to show the name and condensed formula of the dicarboxylic acid missing in the homologous series. [1]

- (ii) What is the general formula of the members in this homologous series?

[1]

- (b) A student claims that dicarboxylic acids are able to undergo condensation polymerisation on its own to form polyesters.

Explain whether you agree with claim.

[1]

- (c) Tartaric acid is a substituted dicarboxylic acid which is found in unripe grapes, making it taste sour. It is a weak, dibasic acid and undergoes neutralisation with potassium hydroxide. The skeletal formula of tartaric acid is shown below.

- (i) Explain the term weak acid and circle the acidic hydrogens on the skeletal formula of tartaric acid.

.....

.....

..... [2]

- (ii) State another physical and chemical property that tartaric acid will exhibit.

physical property: .....

.....

chemical property: .....

..... [2]

- (iii) Suggest two differences in the structural formula between tartaric acid and butanoic acid,  $C_3H_7COOH$ .

.....

.....

.....

..... [2]

- (iv) Tartaric acid can undergo condensation polymerisation reaction with 1, 4-phenylene-diamine to form a polyamide.

The skeletal formula of 1, 4-phenylene-diamine is shown below.

Draw the structure of the polyamide, showing one repeat unit.

[1]

[Total: 10]

**9** A student investigated the rate of reaction in a series of experiments for the following reaction.

The initial rate of this reaction was determined using different concentrations of the reactants as shown in the following experiments. Table 9.1 shows his results.

Table 9.1

experiment	concentration of $C/O_2$ (mol/dm <sup>3</sup> )	concentration of $OH^-$ (mol/dm <sup>3</sup> )	initial rate of reaction (mol/dm <sup>3</sup> s)
1	0.02	0.03	0.00276
2	0.02	0.06	0.00552
3	0.04	0.03	0.01104
4	0.04	0.03	0.00552
5	0.04	0.06	0.02208

From the data in Table 9.1, changes in the concentration of each reactant affect the rate of reaction differently. Knowing how the rate is affected by the concentration of each reactant will allow us to predict the rate of reaction.

We can classify the reactions into the following two types as shown in Table 9.2.

Table 9.2

type of reaction	characteristic	example
<b>First order</b> reaction with respect to reactant <b>A</b>	The rate of reaction is proportional to the concentration of <b>A</b> .	If you double the concentration of <b>A</b> , the rate doubles. If you increase the concentration of <b>A</b> by a factor of 4, the rate goes up 4 times.
<b>Second order</b> reaction with respect to reactant <b>A</b>	The rate of reaction is proportional to the square of the concentration of <b>A</b> .	If you double the concentration of <b>A</b> , the rate would go up 4 times ( $2^2$ ). If you tripled the concentration of <b>A</b> , the rate would increase 9 times ( $3^2$ ).

(a) The student carried out four experiments using solutions at room temperature and one experiment using solutions at a lower temperature.

Which experiment was carried out at a lower temperature?

Explain your reasoning using information from Table 9.1.

[2]

**(b) (i)** Using information from Table 9.1, describe how the rate of reaction changes as the concentration of  $\text{C/O}_2$  changes.

[2]

(iii) Hence, determine the order of reaction with respect to  $\text{C}/\text{O}_2$ .

[1]

(c) Determine the rate of reaction when the concentrations of both  $\text{ClO}_2$  and  $\text{OH}^-$  are  $0.01 \text{ mol/dm}^3$ .

[1]

(d) Explain, in terms of collision between reacting particles, the effect of concentration on the rate of reaction.

[2]

- (e) Oxides of chlorine, other than  $\text{ClO}_2$ , can also exist as  $\text{Cl}_2\text{O}$ . Draw a 'dot-and-cross' diagram to show the bonding in  $\text{Cl}_2\text{O}$ . Show outer electrons only.

### Section B

Answer one question from this section.

- 10 Sphalerite is the chief ore mineral of zinc containing zinc sulfide. It exists in crystalline form and is the most important mineral of zinc.

Fig. 10.1 and 10.2 shows the structures and melting points of zinc sulfide and diamond.

Fig. 10.1

Fig. 10.2

- (a) State the type of structure zinc sulfide has.

[1]

- (b) Explain why the melting points of the two substances differ from each other.

[2]

[2]

[Total: 10]

Zinc can be extracted from sphalerite via reduction by carbon in the blast furnace.

Sphalerite is first heated to produce zinc oxide.

The zinc oxide is then heated in a blast furnace with carbon and hot air.

Zinc vapour and other waste gases are collected at the top of the furnace.

- (c) Draw a 'dot-and-cross' diagram to show the bonding in zinc oxide.  
Show outer electrons only.

[2]

- (d) The three reactions occurring in the blast furnace are known as redox reactions.

With reference to any one of the reactions, explain why it is a redox reaction.

[2]

- (e) The waste gases collected need to be treated before releasing into the environment.

Describe one harmful effect on the environment and one harmful effect on humans if the waste gases are not treated.

[2]

- (f) Briefly describe the method used to separate zinc from the rest of the waste gases.

[1]

[Total: 10]

- 11 Petrol and diesel vehicles are fitted with catalytic converter to reduce the amount of polluting substances emitted from the exhaust. For diesel engines, the catalytic converter may also include a particle filter to remove solid particles of carbon. Fig. 11.1 shows one design of diesel particle filter.

Fig. 11.1

The wall of the particle filter are made from silicon carbide, SiC. This is a hard solid that will **not** melt at the high temperature of the exhaust.

- (a) Suggest how the structure and bonding of silicon carbide makes it resistant to melting, even at high temperature.

.....

.....

.....

.....

.....

.....

[3]

- (b) The catalytic converters make use of catalysts to remove pollutants from the exhaust.

- (i) State the catalysts involved in the catalytic converters.

.....

[1]

- (ii) Describe how the catalysts speed up the reactions for the removal of pollutants.

.....

.....

.....

[1]

- (c) (i) Using the information provided Fig. 11.1, write a balanced chemical equation of a redox reaction that occurs in the catalytic converter.

.....

[1]

- (ii) Identify the oxidising agent for the redox reaction for your answer in (c)(i).

.....

[1]

- (d) Diesel engines may also be fitted with a second catalytic converter to remove the remaining oxides of nitrogen. This second converter uses ammonia as the reducing agent. One possible reaction, for the removal of nitrogen dioxide, is shown by the following **unbalanced** equation.

- (i) Balance the equation by filling in the blanks above.

[1]

- (ii) Nitrogen monoxide is also removed by the catalytic converter as it will damage the ozone layer if released into the atmosphere. The two-step reaction is as shown.

It was discovered that one nitrogen monoxide molecule can destroy thousands of ozone molecules.

Use the equations from steps 1 and 2 to explain why.

.....

.....

.....

.....

.....

.....

KUO CHUAN PRESBYTERIAN SECONDARY SCHOOL  
SECONDARY FOUR EXPRESS CHEMISTRY 6092  
PRELIMINARY EXAMINATION 2024

MARK SCHEME

Section A (70 marks)

1	a	Ar	[1]
	b	Ca, Ar	[1]
	c	C, At	[1]
	d	Na	[1]
	e	Cu, Zn	[1]
	f	C, Pt	[1]
Note: Penalise if incomplete or extra answers are given. Penalise one mark overall if names were given instead of symbols.  Marker's comment: Majority of the students missed out on giving complete answers. Common mistakes for (e) make up of brass is carbon and iron and (f) electrodes is copper and zinc.			

2	<table><tr><th>Mixture</th><th>separation technique</th></tr><tr><td><u>ammonium chloride</u> + sodium chloride</td><td>Sublimation [1]</td></tr><tr><td>water + <u>lead(II) sulfate</u></td><td>Filtration [1]</td></tr><tr><td><u>methanol</u> + glucose solution</td><td>(fractional/simple) distillation [1]</td></tr></table>	Mixture	separation technique	<u>ammonium chloride</u> + sodium chloride	Sublimation [1]	water + <u>lead(II) sulfate</u>	Filtration [1]	<u>methanol</u> + glucose solution	(fractional/simple) distillation [1]	[3]
Mixture	separation technique									
<u>ammonium chloride</u> + sodium chloride	Sublimation [1]									
water + <u>lead(II) sulfate</u>	Filtration [1]									
<u>methanol</u> + glucose solution	(fractional/simple) distillation [1]									
	1m each									
	Marker's comment: Common mistake is to give preparation methods instead of separation techniques. For lead(II) sulfate, evaporation to dryness was rejected as question asked for the <b>most</b> appropriate technique.									

Paper 1 – Multiple Choice Questions (40 marks)

Q1	Q2	Q3	Q4	Q5	Q6	Q7	Q8	Q9	Q10
A	B	B	D	B	B	C	A	D	D

Q11	Q12	Q13	Q14	Q15	Q16	Q17	Q18	Q19	Q20
D	B	A	A	C	A	B	D	C	C

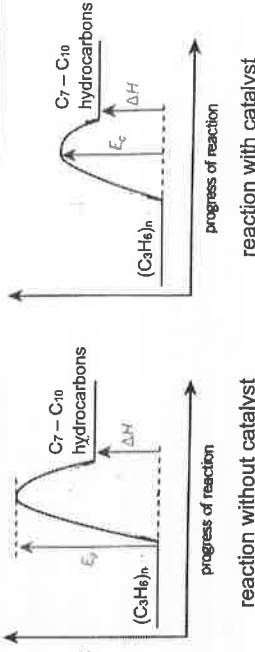

Q21	Q22	Q23	Q24	Q25	Q26	Q27	Q28	Q29	Q30
B	D	D	B	C	A	C	A	C	C

Q31	Q32	Q33	Q34	Q35	Q36	Q37	Q38	Q39	Q40
A	A	C	B	C	C	B	C	C	B

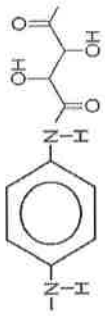

<b>3 a</b>	Thermometer, Conical flask, Measuring cylinder All correct 2m, 2 correct 1m. Penalise for spelling once throughout the paper.	[2]
<b>b</b>	No of mol of Mg = $2 / 24 = 0.083333$ No of mol of HNO <sub>3</sub> = $100 / 1000 \times 1.5$ = 0.150 Mole ratio of Mg : HNO <sub>3</sub> is 1 : 2 For 0.15 mol of HNO <sub>3</sub> used, $\frac{1}{2} \times 0.15 = 0.075$ mol of Mg is needed. As there's 0.0833 mol of Mg, it is in excess. OR For 0.0833 mol of Mg used, $2 \times 0.0833 = 0.167$ mol of HNO <sub>3</sub> is needed. Since there is only 0.15 mol of HNO <sub>3</sub> , it is the limiting reactant and Mg is in excess. Marker's comment: (a) students incorrectly identify gas jar, missing out that the apparatus has markings. (b) poorer response was the inability to do the link/explain clearly why Mg is in excess. Some calculations were given in fractions and was unclear which value was greater/smaller.	[1] [1] [1]
<b>4 a</b>	Ar of Cu = $(69.15/100 \times 63) + (30.85/100 \times 65)$ = 63.617 = 64 (nearest whole number)	[1] [1]
<b>bi</b>	AgNO <sub>3</sub> : <u>White precipitate</u> forms. NH <sub>3</sub> : <u>Light blue / Blue precipitate</u> forms, soluble in excess to give a <u>dark blue</u> solution. Penalize once overall if short-form (ppt) was given.	[1] [1] [1]
<b>bii</b>	Precipitation	[1]
<b>biii</b>	Element    Cu                      F                      K	[3]

	% in 100g    21.5                      38.7                      39.8	
	Ar                      64                      19                      39	
	No. of mol    0.33594                      2.0368                      1.0205	
	Mol ratio    0.33594 / 0.33594                      2.0368 / 0.33594 = 1                      = 6.06	1.0205 / 0.33594 = 3.04
	Simplest ratio    1                      6                      3	
	Empirical formula: <b>CuF<sub>6</sub>K<sub>3</sub></b>	
	1m – Indication of the conversion from % to mass, 1m – workings, 1m – empirical formula (accept any combination of the formula)	
	Markers' comment: (a) poorer response did not follow instructions to give answers to nearest whole number. (b)(i) majority was not able to give complete answers for the observation. Misconception of ppt turning into solution. (b)(ii) most common mistake was "metal displacement". Students did not understand the reaction. (b)(iii) common mistake was not converting % to mass and not showing calculations.	[1] [1] [1] [1] [1] [1] [1]
<b>5 a</b>	Set-up A: Anticlockwise Set-up B: Clockwise	
<b>bi</b>	Zinc electrode in set-up <b>A</b> <u>increased</u> in size, whereas the zinc electrode in set-up <b>B</b> <u>decreased</u> in size. In set-up A, <u>Zn<sup>2+</sup> ions are discharged / gained 2e<sup>-</sup> / reduced to form Zn metal</u> which causes the electrode to <u>increase in size</u> . In set-up B, <u>Zinc is more reactive than copper and loses electrons to form Zn<sup>2+</sup> ions</u> causing the electrode to <u>decrease in size</u> . Set-up A: <u>Zn<sup>2+</sup> (aq) + 2e<sup>-</sup> → Zn (s)</u> Set-up B: <u>Zn (s) → Zn<sup>2+</sup> (aq) + 2e<sup>-</sup></u>	
<b>bii</b>	The copper electrode in <b>A</b> <u>will decrease</u> in size whereas the copper electrode in <b>B</b> <u>will increase</u> in size.	

	The blue aqueous $\text{CuSO}_4$ colour will intensify in <b>A</b> whereas the blue aqueous $\text{CuSO}_4$ colour will fade in <b>B</b> .	
<b>c</b>	$\text{Zn (s)} / \text{ZnO (s)} / \text{ZnCO}_3 \text{ (s)}$ $\text{CuO (s)} / \text{CuCO}_3 \text{ (s)}$ Penalize once for missing state symbols.	[1] [1]
	Markers' comment: (b)(i) students did not read the question carefully that both setup changes in size. Half-equations were missing state-symbols. Explanations were missing the key concept (more reactive metal has a higher tendency to lose electrons) of simple cell. (b)(ii) Students gave only one differences or incomplete comparisons. (c) common mistake was giving salts as answers and students thinking that copper can be used, forgetting that it is an unreactive metal.	
<b>6 a</b>	Ammonia particles are <u>far apart</u> and <u>disorderly</u> . They <u>move about rapidly</u> in all direction.	[1]
<b>b</b>	As the number of bonds between nitrogen atoms <u>increases from single to triple bond</u> , the bond energy <u>increases from 160 kJ/mol to 941 kJ/mol</u> . This is due to a <u>stronger attraction</u> between the nitrogen atoms due to <u>more electrons shared</u> between them, require <u>more energy to break the bonds</u> . Note: Vice versa accepted.	[1] [1]
<b>ci</b>	Total energy absorbed = $941 + 3(436) = 2249 \text{ kJ}$ Total energy released = $2 \times 3(391) = 2346 \text{ kJ}$ Overall enthalpy change = $2249 - 2346 = -97 \text{ kJ}$	[1] [1] [1]
<b>cii</b>	+97kJ	[1]
	Markers' comment: (a) incomplete answers. Commonly missing out the idea of "disorderly" or "rapid movement"	

	(b) misconception that bond were "overcome" when it is broken or that intermolecular forces of attraction were incorrectly discussed showing poor understanding of question. (c)(i) incorrect use of data. N-N data used instead of $\text{N}\equiv\text{N}$ Poor statements given and incorrect calculation of the number of bonds. (ii) missing signs and incorrect units given. 2 moles of ammonia decomposes hence it isn't kJ/mol.	
<b>7 a</b>	 <p>1m – same reactant and product height, labelled 1m – correct <math>E_a</math> / <math>E_c</math> 1m – same <math>\Delta H</math> (endothermic)</p>	[3]
<b>bi</b>	$\begin{array}{c} \text{H} & \text{CH}_3 \\   &   \\ -\text{C} & -\text{C}- \\   &   \\ \text{H} & \text{H} \end{array}$ <p>Empirical formula: <math>\text{CH}_2</math></p>	[1]
<b>bii</b>	$2\text{CH}_2 + 3\text{O}_2 \rightarrow 2\text{CO}_2 + 2\text{H}_2\text{O}$	[1]
<b>biii</b>	<p>No. of mol of poly(propene) = <math>5000 / (12+2)</math> = 357.14</p> <p>Mole ratio of <math>\text{CO}_2</math> : Poly(propene) = 2 : 2 <math>\therefore</math> No. of mol of <math>\text{CO}_2</math> = 357.14</p> <p>Vol of <math>\text{CO}_2</math> = <math>357.14 \times 24</math></p>	[1]

	$= 8571.42$ $= 8570 \text{ dm}^3 \text{ (to 3 s.f.)}$	[1]
<b>c</b>	Advantage: Poly(propene) is <u>durable</u> / <u>does not rust</u> unlike iron. Disadvantage: Poly(propene) is <u>non-biodegradable</u> and would contribute to waste, pollution problems.	[1] [1]
<b>8 ai</b>	Butanedioic acid, $\text{HOOC}(\text{CH}_2)_2\text{COOH}$ OR $\text{HOOCCH}_2\text{CH}_2\text{COOH}$	[1]
<b>aii</b>	$\text{HOOC}(\text{CH}_2)_n\text{COOH}$ OR $(\text{CH}_2)_n(\text{COOH})_2$	[1]
<b>b</b>	<u>Disagree</u> with the claim. It is unable to undergo condensation polymerization on its own as it only has <u>carboxyl functional group</u> . OR <u>does not contain hydroxyl or amine group</u> .	[1]
<b>ci</b>	The term weak acid means the acid undergoes only <u>partial dissociation</u> in water to form $\text{H}^+$ ions. Circle the 2 acidic hydrogen of carboxy functional group.	[1] [1]
<b>cii</b>	Physical property: $\text{pH} < 7$ , turns moist blue litmus paper red, turns green Universal Indicator orange/yellow. (any one) Chemical property: Reacts with metal to produce salt and hydrogen, reacts with metal carbonate to produce salt, water and carbon dioxide, undergoes redox reaction with potassium manganate (VII). (any one)	[1] [1]
<b>ciii</b>	Tartaric acid contain 2 carboxyl groups (per molecule) whereas butanoic acid contains only 1 carboxyl group (per molecule). Tartaric acid contains 2 types of functional groups (per molecule), hydroxyl and carboxyl whereas butanoic acid contains only 1 type of function group (per molecule), carboxyl. Tartaric acid contains a hydroxyl functional group (per molecule), whereas butanoic acid does not.	[2]

	Tartaric acid contains 4 functional groups (per molecule), whereas butanoic acid contains only 1 functional group. Any 2 of the above.	
<b>civ</b>		[1]
<b>9 a</b>	Experiment 4. Comparing Expt 3 and 4, with the same concentration of $\text{C}_2\text{O}_4^{2-}$ and $\text{OH}^-$ , the initial rate of reaction was <u>lower</u> for expt 4, $0.00552 \text{ mol/dm}^3\text{s}$ as compared to expt 3, $0.01104 \text{ mol/dm}^3\text{s}$ .	[1] [1]
<b>bi</b>	The rate of the reaction increases by <u>4 times</u> ( $2^2$ ) when the concentration of $\text{C}_2\text{O}_4^{2-}$ doubles. From experiment 1 and 3, the rate of reaction increases from $0.00276 \text{ mol/dm}^3\text{s}$ to $0.01104 \text{ mol/dm}^3\text{s}$ when the concentration <u>increases from</u> $0.02 \text{ mol/dm}^3$ to $0.04 \text{ mol/dm}^3$ . (OR expt 2 and 5 with evidence)	[1] [1]
<b>bii</b>	Second order reaction Reject: 2 order, order 2, $2^{\text{nd}}$ order.	[1]
<b>c</b>	$0.000230 \text{ mol/dm}^3\text{s}$ Penalise for wrong or missing units.	[1]
<b>d</b>	Increasing concentration increases the <u>number of particles per unit volume</u> . This increases the frequency of collisions between reacting particles. As a result, the <u>frequency of effective collisions increases</u> and the <u>rate of reaction increases</u> .	[1] [1]

e	 <p>1m for correct bonding electrons, 1m for correct valence electrons for all</p>	[2]
---	---	-----

### Section B (10 marks)

10	a	Giant ionic lattice structure	[1]
	b	Zinc sulfide has strong electrostatic forces of attraction between the oppositely charged $Zn^{2+}$ and $S^{2-}$ ions but diamond has strong covalent bonds between the C atoms.  More energy is needed to break the strong covalent bonds in diamond than to overcome the strong electrostatic forces of attraction in zinc sulfide hence melting point of diamond is higher than zinc sulfide.	[1]  [1]
	c	 <p>1m for each ion.</p>	[2]
	d	<p>C is oxidised as it gains oxygen to form <math>CO</math>,  <math>O_2</math> is reduced as it decreases in oxidation state from 0 (in <math>O_2</math>) to -2 (in <math>CO</math>). Hence it is a redox reaction.</p> <p>OR</p> <p><math>ZnO</math> is reduced as it loses oxygen to form <math>Zn</math>.  <math>CO</math> is oxidised as it gains oxygen to form <math>CO_2</math>. Hence it is a redox reaction.</p>	[1] [1]  [1] [1]
	e	<p>Accept all explanations of redox.</p> <p>Environment: <math>SO_2</math> forms acid rain when dissolved in clouds/rainwater which corrodes limestone building/metal structures when it falls. (Accept marine life impact)</p> <p>Human: <math>CO</math> reacts irreversibly with haemoglobin in blood to form carboxyhaemoglobin which reduces the ability to transport <math>O_2</math> which causes breathing difficulties and even death.</p>	[1]  [1]
	f	Cool to room temperature and collect the solid formed / sieve out the solid.	[1]

11	a	<p>Silicon carbide has a <u>giant molecular structure</u>.  A <u>lot of energy</u> is needed to <u>break the strong covalent bonds between silicon and carbon atoms</u>. Hence its melting point is <u>very high</u> and makes it resistant to melting.</p> <p>1m – Structure, 1m – energy + mp, 1m – breaking of strong covalent bonds</p>	[3]
	bi	<p>Platinum, Rhodium and Palladium</p> <p>Note: all must be stated.</p>	[1]
	bii	<p>Catalyst provides an <u>alternative pathway with a lower activation energy</u> which <u>helps increase the frequency of effective collisions</u>.</p>	[1]
	ci	<p>2CO + <math>\dot{\text{O}}_2 \rightarrow 2\text{CO}_2</math>  OR  <math>2\text{NO} + 2\text{CO} \rightarrow \text{N}_2 + 2\text{CO}_2</math>  OR  <math>2\text{C}_8\text{H}_{18} + 25\dot{\text{O}}_2 \rightarrow 16\text{CO}_2 + 18\text{H}_2\text{O}</math>  Accept any <math>\text{C}_n\text{H}_{2n+2}</math> molecules within <math>5 \leq n \leq 25</math></p>	[1]
	cii	<p>OA highlighted above. Allow ecf</p>	[1]
	di	<p>...<u>8</u>.. <math>\text{NH}_3 + \dots</math> <u>6</u>.. <math>\text{NO}_2 \rightarrow \dots</math> <u>7</u>.. <math>\text{N}_2 + \dots</math> <u>12</u>.. <math>\text{H}_2\text{O}</math></p>	[1]
	dii	<p>In step 2, nitrogen monoxide produced is reused in step 1 to react with the ozone again in a <u>continuous cycle</u>.  Thus, there is <u>no net loss of nitrogen monoxide molecules</u>.</p>	[1] [1]
