

Answer to Sec 4 Prelim Exams 2024

Qn	Answer	Mark																
1(a)(i)	<table><tr><td>Final burette reading /cm³</td><td>18.70</td><td>28.90</td><td>28.90</td></tr><tr><td>Initial burette reading /cm³</td><td>0.00</td><td>10.00</td><td>10.00</td></tr><tr><td>Volume of P used /cm³</td><td>18.70</td><td>18.90</td><td>18.90</td></tr><tr><td>Reading chosen</td><td></td><td>✓</td><td>✓</td></tr></table> <p>A-Accuracy (average titre within 0.20 cm³ of teacher's average titre value) [2] (average titre within 0.10 cm³) [1] C- Concordance (two accurate titre values are within 0.20cm³) [1] T- [2] ✓ The table headings and units has to be correct ✓ All burette readings for all accurate titres in titration table are recorded to nearest 0.05 cm³</p>	Final burette reading /cm ³	18.70	28.90	28.90	Initial burette reading /cm ³	0.00	10.00	10.00	Volume of P used /cm ³	18.70	18.90	18.90	Reading chosen		✓	✓	[5]
Final burette reading /cm ³	18.70	28.90	28.90															
Initial burette reading /cm ³	0.00	10.00	10.00															
Volume of P used /cm ³	18.70	18.90	18.90															
Reading chosen		✓	✓															
1(a)(ii)	Average volume of P = (18.90 + 18.90) / 2 = 18.90 cm ³	[1]																
1(b)(i)	Number of moles of sodium hydroxide = 0.200 x 18.90/1000 = 0.00378 mol Number of moles of HA = 0.00378 mol	[1]																
1(b)(ii)	In 25 cm ³ , there are 0.00378 moles of HA. In 1000 cm ³ , there are (0.00378/25) x 1000 = 0.1512 mol Concentration in cleaning product = 0.1512 / 100/1000 = 1.51 mol.dm ³	Working – [1], answer – [1]																
1(c)(i)	 <p>1) Measure 25.0 cm³ of aqueous sodium carbonate using a measuring cylinder and pour the solution into a conical flask. 2) Weigh 1.0 g of solid HA using an electronic balance and place the solid into a small vial. Carefully lower the solid HA into the conical flask, ensuring the chemicals do not mix. 3) Set up the apparatus as shown above. 4) Pull the string to allow the solid HA to react completely with the aqueous sodium carbonate. 5) Assume all the solid HA has reacted with the aqueous sodium carbonate (in excess). 6) Record the total volume of carbon dioxide gas collected in the measuring cylinder when reaction is completed (no more effervescence or more further change in the volume of CO₂) in the conical flask. 7) Calculate the number of moles of CO₂ produced using the formula: volume (in cm³) / 24 000 cm³ = x mol 8) Using the mole ratio HA:Na₂CO₃ = 2:1 Number of moles of HA = 2x mol 9) Using the formula, number of moles of HA = mass of HA / Mr of HA 2x = 1/Mr of HA Mr of HA = 1/2x</p>	Apparatus (measuring cylinder, electronic balance) – [1] Measurement: excess aqueous sodium carbonate – [1] Measurement: Total volume of carbon dioxide collected – [1] Calculation for number of moles of HA – [1] Calculation for Mr– [1]																

1(c)(ii)	Since CO ₂ is soluble in water, the total volume of CO₂ collected would be lower than actual , which will cause the number of moles of CO₂ as well as number of moles of HA to be lower than expected . As a result, the Mr of HA will be larger than actual .			[1] [1] [1]																							
1(c)(iii)	Change: Collect the volume of CO ₂ produced by using a gas syringe instead of displacement of water. Explanation: Volume of CO ₂ will be the true volume as water is absent in the collection of CO ₂ .			[1]																							
2(a)(i)	<table><tr><td>metal carbonate</td><td>X: carbonate of metal R</td><td>Y: carbonate of metal S</td></tr><tr><td>Colour of carbonate before heating</td><td>white</td><td>white</td></tr><tr><td>Colour change during heating/cooling</td><td>Yellow when hot White when cold</td><td>white</td></tr><tr><td>Mass of test-tube and contents before heating /g</td><td>16.31</td><td>16.24</td></tr><tr><td>Mass of test-tube and contents after heating for 1 min /g</td><td>16.14</td><td>16.24</td></tr><tr><td>Mass of test-tube and contents after heating for 2 min /g</td><td>16.09</td><td>16.24</td></tr><tr><td>Mass of test-tube and contents after heating for 3 min /g</td><td>16.07</td><td>16.24</td></tr><tr><td>Total mass loss after heating /g</td><td>0.24</td><td>0.00</td></tr></table>	metal carbonate	X : carbonate of metal R	Y : carbonate of metal S	Colour of carbonate before heating	white	white	Colour change during heating/cooling	Yellow when hot White when cold	white	Mass of test-tube and contents before heating /g	16.31	16.24	Mass of test-tube and contents after heating for 1 min /g	16.14	16.24	Mass of test-tube and contents after heating for 2 min /g	16.09	16.24	Mass of test-tube and contents after heating for 3 min /g	16.07	16.24	Total mass loss after heating /g	0.24	0.00	[2] [1]

Total mass loss after heating /g	0.24	0.00																									
2(a)(ii)	More reactive metal: S Less reactive metal: R Carbonate Y does not decompose at all, showing that it is more thermally stable. Hence, metal S is more reactive. Carbonate X decomposes over the 3 min of heating, showing that it is less thermally stable. Hence, metal R is less reactive.			[1] [1]																							
2(b)(i)	Add aqueous ammonia and sodium hydroxide to the solutions. Observe the colour of ppt, and and their solubility in excess reagents			[1] [1]																							
2(b)(ii)	<table><tr><td></td><td>Solution with metal ions of R (prepared using carbonate X)</td><td>Solution with metal ions of S (prepared using carbonate Y)</td></tr><tr><td rowspan="2">Test</td><td>White ppt, soluble in excess aqueous ammonia, giving colourless solution</td><td>White ppt, insoluble in excess sodium hydroxide</td></tr><tr><td>White ppt, soluble in excess sodium hydroxide, giving colourless solution</td><td>no ppt with aqueous ammonia</td></tr></table>		Solution with metal ions of R (prepared using carbonate X)	Solution with metal ions of S (prepared using carbonate Y)	Test	White ppt, soluble in excess aqueous ammonia, giving colourless solution	White ppt, insoluble in excess sodium hydroxide	White ppt, soluble in excess sodium hydroxide, giving colourless solution	no ppt with aqueous ammonia	[2] [1]
