2024 Secondary 4 Chemistry Prelim Answer Scheme

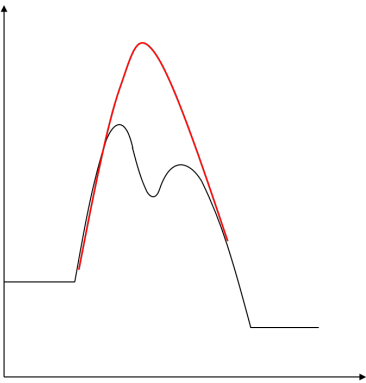

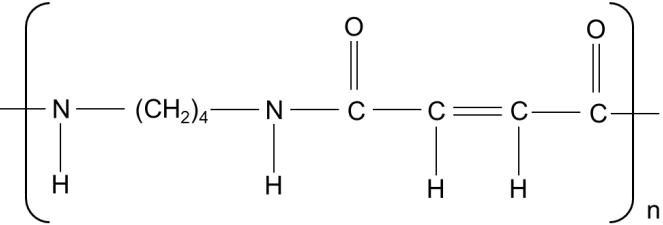

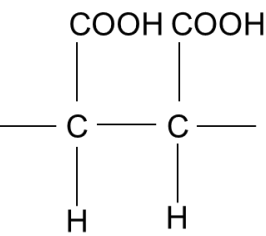

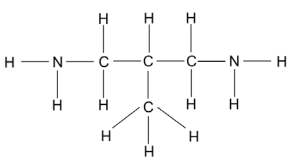

Paper 1

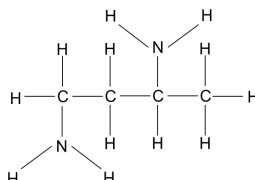

1	2	3	4	5	6	7	8	9	10
C	D	B	B	B	A	C	A	C	D
11	12	13	14	15	16	17	18	19	20
D	B	A	B	C	C	C	D	D	D
21	22	23	24	25	26	27	28	29	30
B	A	D	C	D	B	C	C	D	B
31	32	33	34	35	36	37	38	39	40
A	A	D	D	A	C	B	C	D	C

Paper 2 Section A

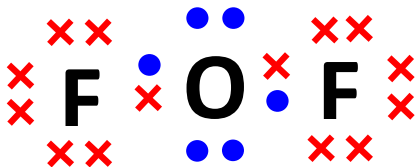

Qn	Suggested answers	Mark
A1	2 Across: <u>fluoride</u>	1
	3 Down: <u>addition</u>	1
	4 Down: <u>alloy</u>	1
	5 Down: <u>sublimation</u>	1
	6 Down: <u>fixed</u>	1
A2a	Sodium: The indicator would turn from <u>green</u> to <u>purple</u> REJECT: Blue Carbon: The indicator would turn from <u>green</u> to <u>orange</u> REJECT: Red	1
A2b	 <p>[1m] – cation [1m] – anion</p>	2
A2c	$4\text{Na} + \text{O}_2 \rightarrow 2\text{Na}_2\text{O}$ No of moles of sodium = $2.30 / 23 = 0.100 \text{ mol}$ $4\text{mol Na} \equiv 2\text{mol Na}_2\text{O}$ $0.100\text{mol Na} \equiv 0.05 \text{ mol Na}_2\text{O}$ Theoretical yield of $\text{Na}_2\text{O} = 0.0500 \text{ mol} \times 62 = \underline{3.10 \text{ g}}$ $4\text{Na} + \text{O}_2 \rightarrow 2\text{Na}_2\text{O}$	1

Qn	Suggested answers	Mark
	<p>Mass gained = $94.82 - 94.50 = 0.32\text{g}$</p> <p>No of moles of oxygen = $0.32 / 16+16 = \underline{0.01 \text{ mol}}$</p> <p>$1\text{mol O}_2 \equiv 2\text{mol Na}_2\text{O}$ $0.0100\text{mol O}_2 \equiv 0.0200 \text{ mol Na}_2\text{O}$</p> <p>Actual Yield = $0.0200 \times 62 = 1.24 \text{ g}$</p> <p>Percentage Yield = $1.24 / 3.10 \times 100\% = \underline{40.0 \%}$</p>	<p>1</p> <p>1</p>
A3ai	<p><u>Bond breaking absorbs energy</u>, hence is <u>endothermic</u>. <u>Bond forming releases energy</u>, hence is <u>exothermic</u>.</p> <p>Since <u>more energy is released than absorbed</u>, the reaction is exothermic.</p> <p>OR</p> <p>The <u>energy absorbed when breaking the bonds in 1 mole of carbon monoxide and 1 mole of chlorine</u> is</p> <p><u>less</u> than the <u>energy released when forming the bonds in 1 mole of phosgene</u>, hence making it an exothermic reaction.</p>	<p>1</p> <p>1</p> <p>1</p> <p>1</p>
A3aii	<p>The oxidation state of chlorine <u>decreased from 0 in Cl_2 to -1 in COCl_2</u>. This is <u>reduction</u>.</p> <p>The oxidation state of carbon <u>increased from +2 in CO to +4 in COCl_2</u>. This is <u>oxidation</u>.</p> <p>Since oxidation and reduction occurs at the same time, this is a redox reaction. (Must state but no marks)</p>	<p>1</p> <p>1</p>
A3b	<p>At -128°C, molecules are packed tightly and <u>very close together</u> in a <u>regular/orderly</u> manner and they can only <u>vibrate about their fixed positions</u>.</p> <p>(As temperature decreases, the molecules move faster and faster) and begin to settle in fixed positions. At -108°C, the phosgene molecules are packed <u>closely together</u> in a <u>disorderly manner</u> and they are able to <u>slide over each other</u>.</p>	<p>1</p> <p>1</p>
A4a	<ul style="list-style-type: none"> Catalysts can be <u>regenerated/are not consumed at the end of a reaction</u>. Thus they can be (reused), so they <u>only need to be purchased once</u> small amount need to be used. 	<p>1</p> <p>1</p>
A4b	<p>In pellet form, there is a <u>higher surface area</u> (per unit volume).</p> <p><u>Higher frequency of effective collisions between reacting particles</u> (and the catalyst), leading to <u>a faster reaction rate</u>.</p>	<p>1</p> <p>1</p>

Qn	Suggested answers	Mark
A4ci		1
A4di	Methyl ethanoate	1
A4dii	$ \begin{array}{c} \text{H} & \text{O} & & \text{H} & & \text{H} & \text{O} & & \text{H} \\ & & & & & & & & \\ \text{H}-\text{C}-\text{C}-\text{Cl} & + & \text{H}-\text{C}-\text{O}-\text{H} & \longrightarrow & \text{H}-\text{C}-\text{C}-\text{O}-\text{C}-\text{H} & + & \text{HCl} \\ & & & & & & & & \\ \text{H} & & \text{H} & & \text{H} & & \text{H} & & \text{H} \end{array} $ <p>[1m] – balanced equation with irreversible arrow [1m] – full structural formula</p>	2
A5a		1
A5bi		1
A5bii	<p>Reaction in (a)(ii) <u>requires a carboxylic acid and an amine.</u> and (b)(i) requires <u>C=C</u> OR Reaction in (a)(ii) results in a <u>loss of small molecules</u>, reaction in (b)(i) has <u>no loss of small molecules</u> OR Water is a byproduct of the reaction in (a)(ii) while there are no byproducts in (b)(i) OR Breaking of C-C double bond in (a)(ii) while no breaking of double bonds in (b)(i)</p>	1
A5c	<p>Any 4 carbon branched chain with 2 -NH₂ groups</p>  <p>OR</p>	1

Qn	Suggested answers				Mark
	Any 4 carbon straight chain with 2 -NH ₂ groups that is not on the terminal carbons. <div></div>				
A6a		C	H	N	
	Mass in 100 g/g	74.1	8.60	17.3	
	No of moles/mol	74.1 / 12 = 6.175	8.60 / 1 = 8.60	17.3 / 14 = 1.236	1
	Mole Ratio	6.175 / 1.236 ≈ 5.00	8.60 / 1.236 ≈ 7	1.236 / 1.236 = 1	
	Empirical Formula	C₅H₇N			1
	Molecular Formula = nC ₅ H ₇ N n = Relative molecular mass / relative formula mass = 162 / 81 = 2				
	Molecular Formula = C₁₀H₁₄N₂				1
A6b	Concentration = 0.123 mol/dm ³ Volume = 2 cm ³ = 2/1000 dm ³ = 0.002 dm ³ Number of moles = Concentration x Volume = 0.123 mol/dm ³ x 0.002 dm ³ = 0.000246 mol Molar mass of nicotine = 162 g/mol Mass = number of moles x molar mass = 0.000246 mol x 162 g/mol = 0.03985 g = 39.9 mg (to 3sf) (convert g to mg)				1
A6c	When a cigarette is smoked, <u>carbon monoxide is inhaled by the smoker and the people around them.</u> Carbon monoxide <u>bonds readily and irreversibly</u> with <u>haemoglobin to form carboxyhaemoglobin/stable compound.</u> This <u>reduces the amount of haemoglobin available to transport oxygen/results in less O₂ transported around the body, leading to fatigue/dizziness, and eventually death.</u>				1
A6(d)(i)	step number	description			1
	2	Soak the ground tobacco in the ethanol solvent.			
	4	Separate the nicotine-rich solution from the solid plant material using process A.			

Qn	Suggested answers			Mark
	5	Obtain nicotine from the mixture of ethanol and nicotine using process B .		
	3	Stir the mixture to enhance the extraction of nicotine into the solvent.		
	1	Grind the dried tobacco leaves into a fine powder.		
A6(d)(ii)	Process A: filtration Process B: Fractional Distillation			1
A7a	T, F, T, T			Any one wrong minus 1
A7bi	<u>Immiscible in water</u> and <u>less dense than water</u> , <u>preventing entry of air/oxygen for the respiration</u> by larvae.			1 1
A7bii	Kerosene has a higher M_r , hence there are <u>Thus more energy is needed to overcome the stronger intermolecular forces of attraction.</u> It is <u>less volatile</u> , so it does not <u>evaporate away easily compared to petrol</u>			1 1
A8ai	To prevent the <u>hot</u> reactive sodium metal and <u>hot</u> chlorine gas from <u>reacting and reforming back sodium chloride.</u>			1
A8aii	<u>No. Hydrogen gas will be produced instead of sodium metal.</u> The electrolyte produced will be <u>sodium hydroxide instead of sodium chloride.</u>			1 1
A8b	$\text{Cu} \rightarrow \text{Cu}^{2+} + 2\text{e}^-$ <u>Copper loses electrons more readily than chloride ions</u> , hence it will be preferentially discharged, forming copper(II) ions instead of chlorine gas			1 1
A8c	<u>No.</u> The litmus paper <u>must be bleached in order to</u> confirm the presence of chlorine.			1
A8di	<u>colourless solution turns brown</u>			1
A8dii	<u>chlorine is more reactive than iodine</u> and it can <u>displace iodine from potassium iodide</u>			1
A9a	Metals <u>X and Y are more reactive than metal W.</u> Metal <u>W is more reactive than metal Z.</u>			1 1
A9b	1. Weigh a piece of metal X. 2. Half fill a test tube with water and stopper with a delivery tube. 3. Place metal X in another test tube. Connect this test-tube to the one with water.			1

Qn	Suggested answers	Mark
	<p>4. Heat the test tube of water until steam is formed and allow the steam to pass over the heated metal X.</p> <p>5. Stop heating when there is colour change observed/after 5 minutes.</p> <p>6. Weigh the resulting solid after heating [method] when it has cooled down.</p> <p>7. Repeat Steps 1 to 6 with metal Y.</p> <p>8. Compare the change in mass for both metals.</p> <p>9. The more reactive metal will have a higher change in mass after 5 mins.</p> <p>[method]: measure volume of gas after 10 minutes/ observe colour change of the solid before and after heating</p>	<p>1</p> <p>1</p> <p>1</p>
A10a	Across period 2, the melting points of the fluoride compounds decreases .	1
A10bi	GeF ₄	1
A10bii	<p>No. The number of F atoms that bond to the halogens should be 1, however, for Cl, Br and I, they can form more than one compound, which have varying number of F atoms that are bonded to them.</p> <p>Or give any counter example: i.e. The number of F atoms that bond to the halogens should be 1, but ClF₃ has 3 F atoms bonded to Cl.</p>	<p>1</p> <p>1</p>
A10biii	<p>The number of compounds formed between a halogen and fluorine is equal to the period number of the halogen minus 1.</p> <p>Or The number of compounds formed between a halogen and fluorine is always an odd number.</p> <p>or The number of compounds formed between a halogen and fluorine increases by 1 as you go down the group.</p>	1
A10biv	<p>ClF₃, BrF₃, BrF₅, IF₃, IF₅, IF₇./Compounds that have more than 1 bond with fluorine.</p> <p>These compounds have <u>more than 8 valence electrons in their outershell</u> Or They do not have a fully filled/noble gas configuration.</p>	<p>1</p> <p>1</p>
A10c	Neon and argon has fully-filled/completely filled valence/outermost electron shells so they are unable to react with fluorine to form compounds.	1
A10d	<p>SA₂ or At₂S</p> <p>Astatine is in the same group as fluorine / also has 7 valence electrons or Astatine atom has 7 valence electrons and will share 1 electron each with 2 sulfur atoms which only has 6 valence electrons.</p>	<p>1</p> <p>1</p>
A10e	 <p>[1m] – bonding electrons</p>	2

Paper 2 Section B

Qn	Suggested answers	Mark
EITHER B11a	Number of moles of nitrogen gas required = $11.7 / 24 = 0.4875 \text{ mol}$ Mole ratio of $\text{NaN}_3 : \text{N}_2 = 2 : 3$ Number of moles of sodium azide required = $(0.4875 / 3) \times 2 = 0.325 \text{ mol}$ Mass of sodium azide required = $0.325 \times (23 + 3(14))$ = 21.125 g = 21.1 g (to 3 s.f.)	1 1 1
B11bi	To produce more nitrogen so that bag will inflate more quickly	1
B11bii	$\text{K}_2\text{O} + \text{Na}_2\text{O} + 2\text{SiO}_2 \rightarrow \text{K}_2\text{SiO}_3 + \text{Na}_2\text{SiO}_3.$	1
B11ci	Precipitation	1
B11cii	$\text{Pb}^{2+}(\text{aq}) + 2\text{N}_3^{-}(\text{aq}) \rightarrow \text{Pb}(\text{N}_3)_2 (\text{s})$ [1m] – ionic equation, [1m] – state symbols	2
B11ciii	Add excess lead(II) carbonate to dilute nitric acid. Filter the mixture to obtain lead(II) nitrate as the filtrate Heat to saturated , then cool and crystallise. Filter the mixture and wash the residue with a small amount of cold distilled water to remove impurities and dry between sheets of filter paper.	1 1
OR B11a	Water contributes/loses a hydrogen ion AND methylamine gains/accepts the hydrogen ion.	1
B11b	Accept any pH value from 8 – 12 Sodium hydroxide is a strong base/alkali but methylamine is a weak base/alkali. Hence, the concentration of hydroxide ions is higher in sodium hydroxide than methylamine. (OR concentration of hydroxide ions is lower in methylamine than sodium hydroxide)	1 1
B11ci	$2\text{CH}_3\text{NH}_2 + \text{H}_2\text{SO}_4 \rightarrow (\text{CH}_3\text{NH}_3)_2\text{SO}_4$	1
B11cii	Methylamine, water, potassium chloride	1
B11di	Green precipitate formed.	1
B11dii	$\text{Fe}^{2+}(\text{aq}) + 2\text{OH}^{-}(\text{aq}) \rightarrow \text{Fe}(\text{OH})_2(\text{s})$ [1m] – ionic equation; [1m] – state symbols	2
B11diii	Green solution turns reddish brown/brown/orange/ yellow.	1
B11div	Oxidising agent	1
